

When we are dividing decimals we can ignore the decimal point in the first instance.

Then we carry out a normal division calculation.

How many 5s in 95?

$$\begin{array}{r}
 19 \\
 5 \overline{) 95} \\
 \underline{5} \phantom{0} \\
 45 \\
 \underline{45} \\
 0
 \end{array}$$

$1 \times 5 = 5$

$9 \times 5 = 45$

Before adding the decimal point back in.

Try doing the same with the following calculations.

$$\begin{array}{r}
 1.9 \\
 5 \overline{) 9.5}
 \end{array}$$

$$3.2 \div 8 =$$

$$8.1 \div 9 =$$

$$5.6 \div 7 =$$
